

DYESKIT

User guide — everything the app can do,
in simple words, with an example for each

Household well-being across the 7 districts of Ladakh · October 2026

For field researchers, supervisors, analysts, administrators and households.

The app at a glance

At the bottom of the screen there are five tabs:

Tab	What it is for
Home	The overall picture: the well-being score, how many households were surveyed, what needs attention.
Villages	All 251 villages of Ladakh by district, with their scores. Also the map.
Collect (the round orange + button)	Start a new household survey, continue a draft, see what is waiting to upload.
Insights	Plain-language findings, priority actions, and Ask the data .
More	All data, analysis, reports, export, survey rounds, users, villages, your account.

Not everyone sees every tab: a household member, for example, sees only Home, Collect and More (see chapter 4).

1 What DYESKIT is

DYESKIT measures how well households in Ladakh are doing — not only money, but health, feelings, community, environment, learning and spiritual life.

A field researcher (or the household itself) answers a survey of about 70 short questions. The app turns the answers into a **well-being score from 0 to 100**, for the household, the village, the district and all of Ladakh. Planners can then see where help is needed most, and what to do first.

The seven dimensions of well-being

Dimension	What it covers	Example question
Physical	Health, nutrition, sleep, sanitation, access to care	“Could you reach a doctor when you needed one last year?”
Financial	Income, savings, livelihoods, security	“Does the household have a bank account?”
Emotional	Mood, support, stress, hope	“Who can you turn to when things are hard?”
Social	Trust, taking part, inclusion, institutions	“Do you take part in village meetings?”
Environmental	Water, food, waste, fuel, climate	“Is your drinking water safe as it is?”
Intellectual	Education, learning, digital skills	“Highest level of education in the household?”
Spiritual	Practice, purpose, peace, culture	“How often do you take part in prayer or worship?”

Example. Stok village scores 70.5 out of 100 — “Advancing Well-Being”. Its strongest side is Spiritual, its weakest is Environmental, mainly because many households worry about water. The panchayat now knows where to start.

2 Getting the app on your phone

Android

1. Open the download link you were sent (an `.apk` file) in Chrome.
2. Tap the downloaded file and choose **Install**. If Android asks, allow “Install unknown apps” for Chrome.
3. Open **DYESKIT** from your home screen.

Later, the app will be on the **Google Play Store** — then you simply search “DYESKIT” and install.

iPhone

Until the app is on the App Store, it opens through the free **Expo Go** app: install Expo Go from the App Store, sign in to it, and open the DYESKIT link you were given. Once published, you will install DYESKIT from the **App Store** like any other app.

Computer

The same app also works in a web browser (Chrome, Safari, Edge) at the project’s web address. Everything in this guide works there too — useful for supervisors and analysts at a desk.

Tip. The app looks the same on Android, iPhone and the web, and follows your phone’s light or dark mode.

3 Signing in and creating an account

Sign in with your phone number (easiest)

1. On the first screen choose **Phone number**.
2. Type your mobile number and tap **Send code**.
3. A 6-digit code arrives by text message. Type it in — you are signed in. No password needed.

Example. Dolma types 98765 43210 , gets the code 482913 by SMS, types it, and she is in.

Sign in with email and password

Choose **Email & password**, type both, tap **Sign in**.

Forgot your password?

Tap **Forgot password**. A code is sent to the phone number on your account; type it, then choose a new password.

New user? Create your account

Tap **New user? Create your account** and choose one of two options:

- **My household** — you want to fill in your own household's survey. You can start **right away**.
- **Project staff** — you will collect surveys or work with the data. An **administrator must approve** you first and give you a role and villages.

Fill in your name, and an email or phone number. You must tick that you accept the **privacy policy** (you can read it first — it says what is collected and why).

Example. Stanzin registers as *Project staff*. He sees “Waiting for approval”. The admin gets an alert, approves him as a Field Researcher for Chuchot and Stok, and Stanzin can now collect surveys there.

Safety limits. To stop misuse, the app limits how many sign-in tries and codes can be requested in a short time. If you see “Too many attempts”, wait 15 minutes.

The image displays two screenshots of the DYESKIT mobile application interface. The top screenshot is the login screen, featuring the app's logo and tagline 'Village well-being across Ladakh'. It offers two login methods: 'Phone number' and 'Email & password'. The 'Phone number' option is selected, showing a field for the mobile number (+91 98765 43210) and a 'Send code' button. Below the login options are links for 'Privacy policy' and 'Server: localhost:4000'. The bottom screenshot is the account creation screen, titled 'Create your account'. It prompts the user to 'Fill in your household's details yourself, or join as project staff'. Two options are presented: 'My household' (selected with a checkmark) and 'Project staff' (unselected). Below these options are input fields for 'FULL NAME' (e.g., Stanzin Dolma), 'EMAIL' (you@example.org), 'PHONE (OPTIONAL)' (+91...), and 'PASSWORD'.

4 Who can do what (roles)

Every account has one role. The role decides what you can see and do. The server checks this every time — not just the app.

Can...	Admin	Supervisor	Field Researcher	Analyst	Viewer	Household member
See dashboards	all villages	all villages	own villages	all villages	all villages	Ladakh only
Collect surveys	✓	✓	✓ own villages	—	—	own household
See household names and phones	✓	✓	✓ own villages	—	—	own only
Approve, send back, correct surveys	✓	✓	—	—	—	—
Delete surveys	✓	—	—	—	—	own only
Insights, map, Ask the data, reports	✓	✓	✓	✓	✓	—
Export to spreadsheet	full	full	—	without names	—	—
Manage villages	✓	✓	—	—	—	—
Manage users, survey rounds	✓	—	—	—	—	—
Audit log (who did what)	✓	✓	—	—	—	—

Example. Tsering is a **Field Researcher** assigned to Changa and Chemday. She can only collect in, and see, those two villages. Sonam is an **Analyst**: he sees all the numbers for Ladakh, but households appear only as codes — never names or phone numbers.

5 The Home screen

Home is the summary of everything you are allowed to see.

- **The big score** — the well-being index (0–100) and its band, e.g. “56.7 · Basic Well-Being Achieved”.
- **Strongest and weakest** dimension, and what “needs care”.
- **Alert banners** — e.g. “103 surveys waiting review · 8 need a look” (chapter 22).
- **Filters** — narrow everything to a district or village (chapter 16).
- **Tiles**: surveys collected (and this month), villages surveyed, reliable villages, dimension flags.
- **Charts**: the seven dimensions, score over time, band distribution, district comparison, top and bottom villages.
- **Change since last round** — once there are two rounds (chapter 11).
- With a district chosen: a **Print report** button for that district (chapter 20).

Example. A supervisor chooses *Nubra* in the filter. The whole screen now shows only Nubra: 113 surveys, score 61.2, weakest dimension Financial.

A **household member** sees a simpler Home: their own household’s result, and the Ladakh-wide picture — never another household or village.

6 Collecting a survey

Step 1 — Open Collect

Tap the round orange **+** button. A welcome message explains why the survey matters (“Your voice shapes your village”), that answers are private and safe, and that it takes about 20 minutes.

Collect also lists your **drafts** (with how far each one got), surveys **waiting to upload**, and any that were **sent back** for a fix.

Step 2 — New household survey

1. **Village** — tap and search by name or code (e.g. “Stok” or “STO”).
2. **Household head** name (private, never shown to analysts) and **phone** (optional).
3. If this household was surveyed **in an earlier round**, tap “**This household was surveyed before**” and pick it — it keeps its household code.
4. **Read aloud the consent text** and tick “The respondent agreed to take part”. Without consent the survey cannot start.
5. Tap **Begin survey**.

New household survey
Step 1 of 2 · household and consent

VILLAGE

Tap to choose the village

HOUSEHOLD HEAD (PRIVATE — NEVER SHOWN TO ANALYSTS)

Optional

PHONE (PRIVATE, OPTIONAL)

+91...

Read aloud before starting

Julley. I am working with Project DYESKIT, a study of village well-being in Ladakh. I would like to ask about your household — health, work, community, environment, and how you feel about life here. It takes about 20 minutes. Your answers are confidential and combined with others; nothing is linked to you by name. You may skip any question or stop at any time. A few questions are personal — you may decline them. Do you agree to take part?

☐ The respondent agreed to take part

Begin survey

Step 3 — Answer the nine sections

	Section
A	Household & demographic profile (age, gender, family size, education...)
B	Physical wellness (incl. height and weight)
C	Mental & emotional wellness
D	Social wellness
E	Environmental wellness
F	Economic & occupational wellness
G	Intellectual wellness
H	Spiritual & cultural wellness
I	Technology & development priorities (top 3)

Stok · Leh · Tsering Dolma

Household & Demographic P... so far

40% filled 42 questions left

Household Physical Emotional Social Environr

A quarter of the way — 40%
Keep going — at 50% the survey can be finished, and every answer after that makes the score fairer.

Context for every other answer. Only education (A13) is scored.

A1 Village *

Stok from step 1

A4 Years household has lived here

— — +
years

A5 Respondent age *

— 40 +
years

Gender
Back Next: Physical

- Move with **Next** and **Back**, or tap a section name at the top to jump.
- Questions with a red * are required.
- Some questions appear only when they apply (e.g. “How many months is water scarce?” only if water is scarce).
- The score “so far” is shown at the top right while you work.
- Every answer is **saved on the phone at once**. Tap X to stop — it stays as a draft.

Step 4 — Review & finish

The last page shows the household’s score, its “shape” across the seven dimensions, and anything still missing. Tap **Finish & upload**. A celebration screen shows the new **household code**, e.g. L_ST0_065 , and the score.

7 The progress bar and the 50% rule

So that people don't stop half-way, the survey shows how far they have got and encourages them to the end.

- The bar at the top fills as questions are **answered**, with “40% filled · 42 questions left”.
- Each section starts with a short message that changes as you go:

Filled	Message
0–24%	A good start — every answer helps paint a true picture of your village.
25–49%	A quarter of the way — at 50% the survey can be finished...
50–74%	Half-way there! — the score now has enough to work with...
75–99%	Almost at the summit — only a few questions left...
100%	Every question answered — thank you!

- When you pass 25%, 50%, 75% and 100% a little cheer pops up.
- A section gets a ✓ when every question in it is answered.
- **Below 50% the survey cannot be finished** — the button says “Fill 50% to finish”, and tapping it takes you to the first open question.
- Between 50% and 99%, finishing asks: “*5 questions still open*” — **Answer the rest** or **Finish anyway**.
- The review page lists the unanswered questions section by section. Tap one to answer it.

Example. A respondent is tired after section D (40%). The researcher sees “A quarter of the way — 40%”, and the Finish button is grey: “Fill 50% to finish”. They do section E together, a cheer pops up — “Half-way there!” — and they decide to complete the last sections too.

Tip. “Don't know” and “Prefer not to say” are answers too — they count towards the progress.

8 Working without internet

Many villages have no signal. That is fine:

- Surveys are saved **on the phone** as you go.
- When you finish without signal, the survey waits in **Collect** → **Waiting to upload**.
- As soon as the phone has internet, it **uploads by itself**. You can also pull down on Collect to try at once.
- Nothing is lost if the app is closed or the phone restarts.

Example. Rinchen surveys 12 households in Hanle with no network. Back in Nyoma that evening, the phone connects and all 12 upload. Each gets its household code.

Do not delete the app or clear its data while surveys are still waiting to upload.

9 Household codes and the 7 districts

Every household gets a short code when its first survey is uploaded:

L_CHL_001 = **L**eh district · village **CHL** (Choglamsar) · household **001**

The code is used everywhere instead of the name, so people can work with the data without knowing who answered. A household surveyed again next year keeps the same code.

Letter	District	Headquarters	Villages
L	Leh	Leh	44
S	Sham	Khaltse	27
N	Nubra	Diskit	30
C	Changthang	Nyoma	24
K	Kargil	Kargil	80 (+ Sankoo)
Z	Zaskar	Padum	26
D	Drass	Drass-Ranbirpura	19

The districts and villages follow the Ladakh Gazette notification S.O. 180 of 27 April 2026.

Example. K_SNK_014 is household 14 of Sankoo in Kargil district; Z_PDM_003 is household 3 of Padum in Zaskar.

10 Households filling in their own survey

Anyone can register as **My household** and fill in their own household's survey — this saves staff time.

- **One survey per household** per round — never for another household.
- They can **edit** or **delete** it at any time (More → **My survey**). Deleting removes it from every count at once.
- They see **their own result** and the **Ladakh-wide** overview only. They never see other households, village names, rankings, insights or exports. Districts with fewer than 10 surveys show no score, to protect privacy.
- Their surveys are marked **self-reported** and count in dashboards only **after a supervisor approves them**.

Example. Padma in Diskit registers with her phone, fills in her survey at home in the evening, and gets the code N_DSK_027 . Next morning the supervisor checks and approves it; now it counts in Diskit's score. Padma sees her household scored 63 — “Advancing”.

11 Survey rounds (every year)

Well-being changes over time, so the same households are surveyed again each year. Each year is a **round** (“2026”, “2027”...).

- An admin starts a new round in **More** → **Survey rounds** → **Start a new round**. From then on, new surveys belong to it.
- Dashboards show the **current round** by default; choose another round, or “All rounds”, in the filters.
- **Change since last round** appears for Ladakh, each district and each village, dimension by dimension.
- One survey per household per round. A repeat survey keeps the household code.

Example. In 2027 Stok rises from 66.0 to 70.5 (+4.5). Environmental went up most (+9) after the new water tank; Financial fell slightly (−1.2).

12 Villages and the village page

The Villages tab

- All villages grouped by district, each with its code, block and score.
- **Search** by name, code or block — e.g. “CHL”, “Nyoma”, “Kharu”.
- Filter by district, or tap **Surveyed only**.
- Each district shows its average score.
- **See them on the map** opens the map (chapter 13).

The village page

Tap any village to see:

- The village score, band, and number of households surveyed.
- **Reliability**: a village result is called **reliable** once 30% of its households (and at least 10) are surveyed. Otherwise it shows how many more are needed.
- The seven dimensions compared with the average of all villages.
- Change since the last round, problems, priorities.
- **Print report** (chapter 20).

Example. Stok: 70.5, “Advancing”. 64 of 210 households surveyed = 30.5% — **✓ reliable**.
Changa has 1 survey of 140 households — “needs 41 more”.

13 The map of villages

Villages → **See them on the map** (staff only).

- Every village is a dot. **Colour** = its score (red low, green high). **Bigger dot** = more surveys. Small grey dots are not yet surveyed.
- Each district's area is shaded in its own colour.
- Tap a district name at the top to zoom into it.
- **Tap a dot** to see the village, its score and number of surveys, and open it.
- Works offline — no map service needed.

176 of the 251 village positions came from OpenStreetMap and are approximate. Admins can add or correct a position in **Villages & households** — by typing it, or by standing in the village and tapping **Use my current location**.

Example. On the map, the eastern Changthang dots are yellow and orange while Leh's are green — the district officer sees at a glance that the remote villages need more attention.

14 Insights

Findings in plain words, each one a count you can check.

- **Priority actions** — problems ranked by how many households they affect, with a suggested first step and the villages where they are worst. Levels: **Critical** **Serious** **Watch**
- **Villages that can learn from each other** — where one village does much better than a similar one on the same problem.
- **Bright spots** — villages doing very well in a dimension, worth sharing.
- Use the filters (district, village, period, gender, age, religion) to focus.

Example. “Drinking water not safe as it is — 624 of 775 households (81%). *Test the sources, then prioritise treatment or a protected source.* Worst in Changa 100%, Durbuk 98%.”

15 Ask the data (chat assistant)

Insights → **Ask the data** (staff only). Type a question in everyday words and get a short answer, **with the table it was taken from**.

Questions you can ask

- “How are we doing overall?”
- “Which villages in Kargil need the most help?”
- “Best villages in Leh”
- “Compare the districts”
- “What problems affect the most households in Nubra?”
- “What did households in Stok ask for?”
- “What changed since the last round?”
- “Do women score differently from men?” / “Does age make a difference?”
- “Lowest questions in Zaskar”
- “How is the score calculated?”

Suggestion chips at the bottom give ideas for the next question.

Example. Q: “Which villages in Leh need the most help?” — A: “Lowest-scoring villages in Leh district: Sakti (57.0), Choglamsar (66.3), Changa (69.4).” plus a table with each village’s score and number of households.

Privacy. The assistant only sees the villages you are allowed to see, and only totals — never a single household.

It works in two ways: **quick answers** (free, from fixed rules — the default), or **AI answers** by Claude when the administrator adds an AI key on the server. AI answers understand more varied questions.

16 Explore analysis and filters

More → **Explore analysis**: every chart follows the filters.

- **Who is doing better?** — scores by gender, age group, religion, occupation, education, family type, housing and household size.
- **Focus on one dimension** — which questions pull it down, and where.
- **Villages at a glance** — every village side by side.
- **Life in the villages** — water, fuel, income, glaciers.
- **Technology readiness** — smartphones, internet, interest in AI.
- **Data quality** — surveys by status, short interviews, missing height/weight.

Filters

The **Filters** bar appears on Home, Insights and Explore. You can choose: district, village, round, period (this month, last 3 months, this year...), gender, age group, religion, and status.

Example. Choose *Kargil + Female + 18–29*: young women in Kargil score 54.1, lowest in Financial (41.0) — a lead for a livelihoods programme.

17 How scores work

Simple fixed points — no complicated formulas. The full table of points is in [More → How scores work](#).

1. **Each answer has fixed points from 0 to 100.** The best answer gets 100, the worst 0. “Don’t know” or “Prefer not to say” gets 50. A skipped question is simply left out.
2. **Dimension score = average of its answered questions** (needs at least half its questions, and at least 2).
3. **Household score = average of the 7 dimensions** (needs at least 5 of the 7).
4. **Village / district / Ladakh score = average of their households.**
5. **The score falls into one of 7 bands.**

Worked example — Physical dimension of one household.

Sleep “Mostly” = 67 · Toilet with proper disposal = 100 · Health facility 1–10 km away = 75 · Could not reach care more than once last year = 0 · (other Physical questions left out here for simplicity)

Physical = $(67 + 100 + 75 + 0) \div 4 = 60.5$

If the 7 dimensions are 60.5, 52, 61, 70, 45, 58 and 80 → household = $426.5 \div 7 = 60.9$ → **band 5, Advancing.**

How scores work

The whole method, with every point value

In one sentence

Every answer is worth fixed points out of 100; averages of those points give each dimension, each household, and each village.

Five steps

1 Each answer has fixed points

Every scored question gives a set number of points from 0 to 100 for the answer chosen — no formulas. “Don’t know” or “Prefer not to answer” gives 50. A skipped question is simply left out.

2 Dimension score = average of its questions

Add the points of the answered questions in a dimension and divide by how many were answered. A dimension counts only if at least half of its questions (and at least 2) are answered.

3 Household score = average of the 7 dimensions

Each dimension weighs the same. A household gets a score once at least 5 of the 7 dimensions count.

4 The score falls into one of 7 bands

From “Foundational Support Needed” (below 15) to “Thriving” (85 and above). See the bands

Band	Score	Name
1	0 – 14.9	Foundational Support Needed
2	15 – 28.9	Emerging Well-Being
3	29 – 42.9	Developing Well-Being
4	43 – 56.9	Basic Well-Being Achieved
5	57 – 70.9	Advancing Well-Being
6	71 – 84.9	Strong Well-Being
7	85 – 100	Thriving Well-Being

Flags: a dimension below **43** (“Basic”) is flagged; below **29** it is **critical**. **Reliable village:** at least 30% of its households, and at least 10, surveyed.

18 Checking the data (All data)

More → **All data** (admins and supervisors). Go step by step: **district** → **village** → **household**.

- At the top: surveys in total, **waiting review**, **need a look**, self-reported.
- Choose a round, or “All rounds”.
- **Every survey that needs a look** and **Everything waiting review** — one tap to the work to do.
- Each district, then each village, shows its counts; tap to go down a level.
- In a village: every household, who collected it, when, how long it took, its score and status. Filter by Needs a look, Waiting review, Approved, Sent back, Self-reported, or by staff member.

Automatic warnings (“needs a look”)

Warning	When
Short interview	Took less than 10 minutes
Not enough answers	Too few answers for a score
Height/weight look wrong	BMI below 12 or above 45
Age looks wrong	Under 18 or over 105
Very large household	More than 20 people
Same answer to all	8 or more agreement questions all given the same answer
Possible duplicate	Same village and round, with the same phone number or the same head’s full name

Example. “Possible duplicate of L_STO_041 (same phone)” — the supervisor opens both, sees the same family was surveyed twice by two researchers, and deletes one.

19 Correcting, approving, deleting

Open any survey (from All data or More → **Surveys**) to see every answer, its score, warnings, round and who collected it.

- **Approve** — the survey is checked and fine.
- **Send back to the researcher** — write what needs fixing. The researcher gets an alert, corrects it, and it returns to the queue.
- **Correct an answer** — change it and give a **reason** (required). The score is recalculated, and the **change history** keeps the old value, the new value, who and why.
- **Approve all clean** — in a village, approves at once every waiting survey with no warnings.
- **Delete** (admins) — the survey leaves every score at once and goes to the **Recycle bin**, from where it can be **restored**.

Example. Weight was typed as 650 kg. The supervisor corrects it to 65 with the reason “typing error, confirmed by phone”. The BMI warning disappears and the score is recalculated. The history shows: *B1 weight 650 → 65 · Dolma Angmo · typing error...*

Every important action is written in the **Audit log** (More → Audit log): sign-ins, approvals, corrections, deletions, changes to users and villages.

20 Printable reports (PDF)

A one- or two-page A4 report for a panchayat or council meeting. Tap **Print report**:

- on a **village page** → report for that village;
- in **All data** → **a district**, or on **Home with a district chosen** → report for the whole district.

The report shows: the score and band, households surveyed and whether the result is reliable, change since the last round, the seven dimensions as bars, what needs attention (with suggested actions), what households asked for, bright spots, the lowest-scoring questions and, for a district, which villages have flags.

On a phone you can **save it as PDF, print it, or share it** (WhatsApp, email...). On a computer it opens the print window — choose “Save as PDF”.

Example. Before the Gram Sabha in Drass, the supervisor prints the Drass report: score 58.3, “Advancing”; needs attention — households far from a health facility (62%); top request — better roads. Totals only, no household is named.

21 Export to a spreadsheet

More → **Export to spreadsheet** → **Download CSV**. Opens in Excel, Google Sheets, SPSS or R.

- One row per household: village, district, round, status, source, score, band, the seven dimension scores, and every answer.
- Uses the same filters (e.g. only Nubra, only approved).
- **Admins and supervisors** get household codes; **analysts** get the data without names, phones or codes. Names and phone numbers are never exported.

Example. An analyst exports all approved surveys of round 2026 and studies, in Excel, how distance to a health facility relates to the Physical score.

22 Alerts

A red dot on **More** and banners on **Home** tell you when something needs you:

Who	Gets an alert for
Admin	People waiting for approval
Admin, Supervisor	Surveys waiting review, and surveys that need a look
Field Researcher, Household member	Their own surveys that were sent back to fix

Example. The banner says “3 surveys sent back to you”. Tsering taps it, sees “Age looks wrong (4)”, fixes it to 40, and the survey goes back to the supervisor.

23 Administration

Users & approvals (admins)

- **Waiting for approval** — approve or decline new staff; choose their role and **assign villages**.
- **Add a user** yourself, with a temporary password.
- Change a role, **disable** / re-enable an account, or **delete** a user. Deleting erases the person’s account but keeps the surveys they collected. An admin cannot delete themselves.

Villages & households (admins, supervisors)

- Set the **number of households** in each village — needed to know when a village result is reliable.
- Add a village that is missing (it gets a 3-letter code), edit block and altitude.
- Set the **map position**: type latitude/longitude, or tap **Use my current location** while in the village.

Survey rounds (admins)

Start a new round each year (chapter 11).

Audit log and Recycle bin

See who did what and when; restore deleted surveys.

Example. The admin sets Stok to 210 households. With 64 surveyed (30.5%), Stok becomes “reliable”.

24 Your account and privacy

More → **Account & privacy**:

- **Change your password**, or set one if you signed up with only a phone number.
- Read the **privacy policy** (also public on the web at </privacy>).
- **Delete your account** — your personal details are erased.
- **Sign out**.

How privacy is protected

- Names and phone numbers are visible only to staff who need them, and never exported.
- Analysts and viewers see households only as codes.
- Reports, the map, insights and Ask the data use totals only.
- Household members see only their own survey.
- Consent is recorded for every survey.
- Sign-in attempts and codes are limited to stop misuse.

25 Quick answers

Question	Answer
My survey shows “Waiting to upload”.	The phone has no internet. It uploads by itself when there is signal. Keep the app installed.
The household score shows “—”.	Not enough answers yet: a household needs at least 5 of the 7 dimensions answered.
I can’t press Finish.	Fill at least 50% of the survey and answer the questions marked *.
A village says “needs 12 more”.	12 more households must be surveyed before its result is reliable.
I registered but can’t do anything.	Staff accounts wait for an admin’s approval. Household accounts can start at once.
I can’t see a village.	Field researchers only see their assigned villages. Ask an admin to assign it.
A household was surveyed last year.	Choose “This household was surveyed before” so it keeps its code.
I deleted a survey by mistake.	An admin can restore it from More → Recycle bin.
A village is in the wrong place on the map.	An admin corrects it in Villages & households.
“Too many attempts”.	Wait 15 minutes and try again.
